Test report 361/22

Ha

14/09/2022

page 1 of 3

Customer: Ms. Oda Nimmer
 Assignment from: 06/09/2022
 Received: 06/09/2022

Assignment:

No.	Test	Standard
		Test conditions
1.	specific thermal conductivity λ	Alambeta method
		Temperature difference 10 K contact pressure of the plunger 10 cN/cm ² Number of test specimen: 5
2.	thermal resistance r	Alambeta method
		Temperature difference 10 K contact pressure of the plunger 10 cN/cm ² Number of test specimen: 5
3.	specific heat capacity c_v	Alambeta method
		Temperature difference 10 K contact pressure of the plunger 10 cN/cm ² Number of test specimen: 5

Samples:

Sampling: The samples were taken by the customer.

Realisation of the test: The measurement samples were taken and tested in compliance with the above-mentioned regulations.

Testing period: 06/09/2022 – 08/09/2022

Test results:

1. Specific thermal conductivity λ

λ = Quantity of heat, which is passing a material with 1 m² surface and 1 m thickness per second, if there is a temperature difference of 1K between both sides.

λ in	mW	mW	Milliwatt
	-----	m	meter
	m K	K	Kelvin

	right side	reverse side
\bar{x}	51.0	45.7
x_{\max}	54.9	47.2
x_{\min}	48.1	44.3

The lower the value of the specific thermal conductivity, the less heat is transported and dissipated, the better the thermal insulation.

2. Thermal resistance r

r = Temperature difference between the upper side and the reverse side of a material with a surface area of 1 m² and a given thickness, if a heat flux of 1 Watt is passing through.

r in	mK m ²	mK	Millikelvin
	-----	m ²	square meter
	W	W	Watt

	right side	reverse side
\bar{x}	23.9	26.8
x_{\max}	26.1	28.3
x_{\min}	21.8	26.1

The higher the value of the heat resistance, the poorer the heat is transported and dissipated.

3. Specific heat capacity

c_v = volumic heat storage capacity of a material

c_v in	$\frac{\text{mW}}{\text{K m}^3} \cdot 10^3$	$\frac{\text{mW}}{\text{s K m}^3}$	Milliwatt seconds Kelvin cubic meter
----------	---	------------------------------------	---

	right side	reverse side
\bar{x}	241.5	301.6
x_{\max}	282.9	325.3
x_{\min}	209.5	278.8

The higher the value of the heat capacity, the more heat can be stored in volume.

The testing results are exclusively related to the sample under conditions as received.

Without written permission of the testing laboratory it is inhibited to copy this report partially.
